

STRATEGY 7 Introduces:

IBM InfoSphere

WebSphere Information Analyzer

“Critical Component that Profiles & Analyzes Data”

Now there's a way-- for existing Data Stage users to automatically scan samples of your data to determine quality and structure.

This analysis aids you in understanding the inputs to your integration process, ranging from individual fields to high-level data entities. Information analysis also enables you to correct problems with structure or validity before they affect your project.

WebSphere Information Analyzer represents the next generation in data analysis tools:

End-to-end data profiling and content analysis

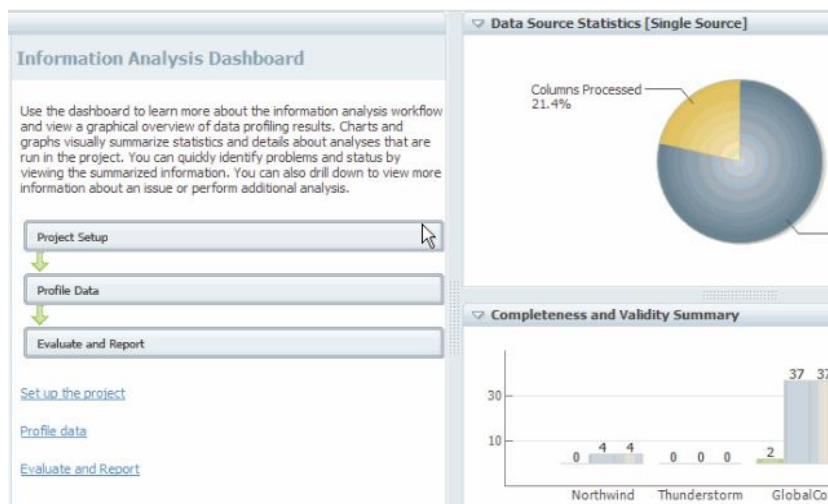

- Provides standard data profiling features and quality controls.
- Repository holds the data analysis results and project metadata.

Business-oriented approach

- Task-based user interface, aids business users in easily reviewing data for anomalies.
- Provides key functional and design information to developers.

Adaptable, flexible, and scalable architecture

- Handles high data volumes with common parallel processing technology.
- Leverages common services to access a wide range of data sources and targets.

Let us show you the benefits. Call Your Strategy 7 Representative Today 949-719-9410.
